### Installation of the sample and measurement

Sample has been installed into the hole  $(1500 \times 1250)$  of the dividing wall between two reverberating chambers by workers of the laboratory. The installation of the specimen is described on the drawing in Annex 2. The airborne sound reduction index has been determinate by using the precision integrated noise spectra meter, positional microphone and loudspeaker.

## Methods and equipment

The airborne sound reduction index R was determinated in accordance with requirements of LST EN ISO 10140-1:2010 [1], LST EN ISO 10140-2:2010 [2], LST EN ISO 10140-4:2010 [3], LST EN ISO 10140-5:2010, [4]. Weighted sound reduction index  $R_w$  was determinated in accordance with requirements LST EN ISO 717-1:1999 [5].

The thickness of the reverberating chamber's walls is 0,25m. The thickness of the covering masonry shell is 0,38m. The dimensions of the floor of sound chamber are 4,9x4,8m, height  $-3,5\div3,0m$  (the coming down by steps ceiling). The dimensions of the floor of the sound receiving chamber are 4,8x4,3m, height  $-3,5\div3,0m$  (the coming down by steps ceiling). The chamber's volumes are 80 and 68,56m<sup>3</sup>.

## **Equipment of the measurement:**
